

## Introduction to Chemistry

**Chemistry** is the study of \_\_\_\_\_: its \_\_\_\_\_ (what it is made of), its \_\_\_\_\_ (characteristics) and \_\_\_\_\_ (how it can change).

**Matter** is anything that has \_\_\_\_\_ and \_\_\_\_\_ (takes up space). Matter is the science word for “stuff”.

The **Atomic Theory of Matter** states that all matter is made up of \_\_\_\_\_. An **atom** is the smallest unit of matter that we deal with in “every-day” chemistry.

Atoms, in turn, are made up of three types of sub-atomic particles: \_\_\_\_\_, \_\_\_\_\_ and \_\_\_\_\_.

The number of protons in the nucleus of an atom is called the “\_\_\_\_\_”. The atomic number determines the identity of that atom.

All of the different types of atoms (also called “elements”) are arranged by atomic number on the Periodic Table of the Elements.

|                   |   |       |    |       |
|-------------------|---|-------|----|-------|
| eg. atomic number | 6 | _____ | 79 | _____ |
|                   | 7 | _____ | 80 | _____ |

When an atom is in a \_\_\_\_\_ (uncharged) form, the number of electrons is \_\_\_\_\_ to the number of protons.

Electrons are arranged in \_\_\_\_\_ (energy levels) around the nucleus as shown in “Bohr-Rutherford” diagrams. The electron shells are filled in order, moving out from the nucleus:

- The first shell can hold \_\_\_\_\_ electrons.
- The second shell \_\_\_\_\_
- The third shell \_\_\_\_\_
- The fourth shell \_\_\_\_\_

The electrons in the outer shell are called \_\_\_\_\_

## The Elements

All known types of atoms are shown on the \_\_\_\_\_.  
Each type of atom (element) has a different number of \_\_\_\_\_.

The number of protons in the nucleus of an atom is called the \_\_\_\_\_.  
The atomic number determines the \_\_\_\_\_ of that atom.

eg. atomic number 7 (7 protons) is \_\_\_\_\_  
atomic number 47 is \_\_\_\_\_  
atomic number 78 is \_\_\_\_\_

In an uncharged (\_\_\_\_\_) atom, the number of electrons is \_\_\_\_\_  
the number of protons. The electrons are found in \_\_\_\_\_ (energy levels) around the  
nucleus, as shown in \_\_\_\_\_ diagrams. The electrons in the outer shell  
are called \_\_\_\_\_.

The number of \_\_\_\_\_ determines an atom's \_\_\_\_\_ and  
\_\_\_\_\_ (how the atom will behave).

The number of protons plus the number of neutrons is called the \_\_\_\_\_.  
Atoms may have the same number of protons (that is, they are the \_\_\_\_\_ )  
but they may have \_\_\_\_\_. All that this means is that some  
atoms of an element are \_\_\_\_\_ but they still have the same  
\_\_\_\_\_ properties.

Atoms that have the same \_\_\_\_\_, but different  
\_\_\_\_\_ are called “\_\_\_\_\_”.

Chemists use the following short form for elements and their isotopes:

**mass number:** \_\_\_\_\_  
12 ← \_\_\_\_\_ eg. “C” is the chemical symbol for \_\_\_\_\_  
C ← \_\_\_\_\_  
6 ← **atomic number:** \_\_\_\_\_

### Summary:

# of protons = the atomic number, this determines the type of atom (element)

# of electrons = the # of protons in an uncharged (neutral) atom

# of neutrons = the mass number – the atomic number

eg.  ${}_{18}^{40}\text{Ar}$                        ${}_{18}^{41}\text{Ar}$                        ${}_{18}^{42}\text{Ar}$

## Grade 10 Science Review of Atomic Structure #1

**Chemistry** is the study of matter, its properties and its transformations (how it can change).

**Matter** is anything that takes up space and has mass.

The smallest particle of matter that we are concerned with in “normal” chemistry is the atom. Over the centuries, many researchers did experiments (remember Crookes, Thomson, Rutherford and Bohr?) and discovered that the atom is made up of two different regions: a very dense central nucleus which is made up of protons and neutrons, and a “cloud” area around the nucleus that is mostly empty space, but contains the electrons. The three different types of sub-atomic particles (protons, neutrons and electrons) have the following characteristics:

- (1) Protons are found in the atom’s nucleus, have +1 unit of electrical charge and weigh about 1 atomic mass unit, u. The number of protons in atoms distinguishes the elements from one another. The number of protons, called the **atomic number**, varies from 1 for the element hydrogen to over 100. The atomic number, then, identifies the element.
- (2) Neutrons are also found in the atom’s nucleus and, as their name suggests, are electrically neutral i.e. their charge is zero. Their mass is about 1 u. There is no relationship between the numbers of neutrons and protons. However, since these two particles give most of the mass to an atom, the total number of neutrons and protons is called the **mass number**.
- (3) Electrons are found in the space around the nucleus and have -1 unit of electrical charge. They are some 2000 times smaller than protons and neutrons. For this reason their mass is quite often given as 0 u. In a neutral atom the number of electrons equals the number of protons. In an electrically charged atom (an ion) the number of electrons can be more or less than the number of protons. For example, the electric charge on an atom with 20 protons and 18 electrons is +2.

There are 105 unique elements that have been discovered, to date. Each element is identified by the number of protons in the nucleus, or its atomic number. An atom that has the atomic number “one” has one proton in its nucleus is always the element, hydrogen. An atom with the atomic number “two” has two protons and is always helium, three protons is lithium etc. The elements are arranged in order of increasing atomic number in the Periodic Table of the Elements. The number of neutrons and electrons is not important in identifying the element.

Each element has been given a one or two letter abbreviation. Often, the abbreviation is written with additional information in the following format:

$^{12}_6\text{C}$  : -“C” is the chemical symbol for carbon  
- 6 is the **atomic number, Z**, this is the number of protons in the nucleus  
- 12 is the **mass number, A**, this is the number of protons plus the number of neutrons in the nucleus  
- for an uncharged or neutral atom, the number of electrons equals the number of protons

Some elements have different numbers of neutrons in their nuclei (remember, the same element always has the same number of protons or atomic number). The different numbers of neutrons in the nuclei mean that the nuclei will be heavier, or have a larger mass number. Atoms that have the same number of protons, but different numbers of neutrons are called **isotopes**.

The **atomic mass** for an element is the average mass of the atoms (isotopes) for that element, and this is the number reported on the Periodic Table.

## Review of Atomic Structure #1

- The three sub-atomic particles in an atom are \_\_\_\_\_ , \_\_\_\_\_ and \_\_\_\_\_ .
- Complete the following chart comparing the three types of sub-atomic particles:

| Name of Particle | Location in Atom | Mass | Charge |
|------------------|------------------|------|--------|
|                  |                  |      |        |
|                  |                  |      |        |
|                  |                  |      |        |

- Which type of sub-atomic particle determines the identity of an atom? \_\_\_\_\_
- Atoms having the same number of protons but different numbers of neutrons are called \_\_\_\_\_ .
- The mass number of an atom having 20 protons, 20 electrons and 22 neutrons is \_\_\_\_\_ .
- Complete the following chart, for the following neutral (uncharged) atoms:

| Name of Element | Symbol for Element | Atomic Number | Number of Protons | Number of Electrons | Number of Neutrons | Mass Number |
|-----------------|--------------------|---------------|-------------------|---------------------|--------------------|-------------|
|                 | Be                 |               |                   |                     |                    | 9           |
|                 |                    | 16            |                   |                     | 17                 |             |
| Silicon         |                    |               |                   |                     | 14                 |             |
|                 | Fe                 |               |                   | 26                  |                    | 56          |
|                 |                    |               |                   | 55                  |                    | 133         |
|                 |                    | 84            |                   | 84                  | 124                |             |
|                 |                    |               | 13                |                     |                    | 27          |
| Krypton         |                    |               |                   |                     | 48                 | 84          |

- What information does each of the following symbols tell us about the following neutral atoms?

| Symbol                | Name of Element | Atomic # | Mass # | # of Protons | # of Neutrons | # of Electrons |
|-----------------------|-----------------|----------|--------|--------------|---------------|----------------|
| $^{16}_8\text{O}$     |                 |          |        |              |               |                |
| $^{31}_{15}\text{P}$  |                 |          |        |              |               |                |
| $^{25}_{12}\text{Mg}$ |                 |          |        |              |               |                |
| $^{40}_{19}\text{K}$  |                 |          |        |              |               |                |
| $^{20}_{10}\text{Ne}$ |                 |          |        |              |               |                |

- Refer to your note from class to complete the following chart comparing metals and non-metals:

| Characteristic                                 | Metals | Non-metals |
|--|--------|------------|
| Found on which side of the Periodic Table?     |        |            |
| How many valence electrons do they have?       |        |            |
| What is their usual state at room temperature? |        |            |
| What is their usual colour?                    |        |            |
| Are they shiny or dull?                        |        |            |
| Do they conduct electricity?                   |        |            |
| Are they malleable or brittle as solids?       |        |            |

- Predict five properties (characteristics) of the element hafnium (Hf).

## The Periodic Table: Rutherford-Bohr Diagrams

**${}^1\text{H}$**

1. Write the number of protons (atomic number) in the nucleus of each atom.
2. The number of electrons equals the number of protons in a neutral atom. Draw the electrons in the shells:
  - a) the first shell holds up to \_\_\_\_ electrons
  - b) the second shell holds up to \_\_\_\_ electrons
  - c) the third shell holds up to \_\_\_\_ electrons
  - d) the fourth shell holds up to \_\_\_\_ electrons

**${}^2\text{He}$**

**${}^3\text{Li}$**

**${}^4\text{Be}$**

**${}^5\text{B}$**

**${}^6\text{C}$**

**${}^7\text{N}$**

**${}^8\text{O}$**

**${}^9\text{F}$**

**${}^{10}\text{Ne}$**

**${}^{11}\text{Na}$**

**${}^{12}\text{Mg}$**

**${}^{13}\text{Al}$**

**${}^{14}\text{Si}$**

**${}^{15}\text{P}$**

**${}^{16}\text{S}$**

**${}^{17}\text{Cl}$**

**${}^{18}\text{Ar}$**

**${}^{19}\text{K}$**

**${}^{20}\text{Ca}$**

**${}^{21}\text{Sc}$**

### Questions:

1. What pattern do you notice about the number of valence electrons as you go down each column? \_\_\_\_\_
2. Which elements have **one** valence electron? \_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_ & \_\_\_\_\_
3. Which elements have **two** valence electrons? \_\_\_\_\_, \_\_\_\_\_ & \_\_\_\_\_ (\_\_\_\_\_)
4. Which elements have **three** valence electrons? \_\_\_\_\_, \_\_\_\_\_ & \_\_\_\_\_
5. Which elements have **seven** valence electrons? \_\_\_\_\_ & \_\_\_\_\_
6. Which elements have a **full** outer shell (stable octet)? \_\_\_\_\_, \_\_\_\_\_ & \_\_\_\_\_

## Organization of the Periodic Table

The elements on the Periodic Table are organized in four main ways:

1. By increasing \_\_\_\_\_ (increasing number of \_\_\_\_\_).
2. Into \_\_\_\_\_ (horizontal rows):
  - all elements in a Period have the same number of \_\_\_\_\_.
  - (For example: all elements in the second Period have \_\_\_ shells, while those in the fourth Period have \_\_\_ shells)
3. Into \_\_\_\_\_ or \_\_\_\_\_ (vertical columns):
  - all elements in a Group have the same number of \_\_\_\_\_, which gives them similar \_\_\_\_\_ and \_\_\_\_\_ properties.
  - the Group number tells us how many \_\_\_\_\_ the atoms in the Group have. (For example: Group I elements have \_\_\_ valence electron, while Group VII elements have \_\_\_ valence electrons).
4. By the “\_\_\_\_\_” into Metals, Non-metals and Metalloids:
  - a) Metals
    - found on the \_\_\_\_\_ side of the “staircase” line
    - have \_\_\_, \_\_\_ or \_\_\_ valence electrons
    - are usually \_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_-coloured and are \_\_\_\_\_ conductors of electricity
    - tend to \_\_\_\_\_ valence electrons (form \_\_\_\_\_ charged ions called \_\_\_\_\_)
  - b) Non-Metals
    - found on the \_\_\_\_\_ side of the “staircase” line
    - have \_\_\_, \_\_\_, \_\_\_ or \_\_\_ valence electrons
    - are usually \_\_\_\_\_, \_\_\_\_\_, can be any \_\_\_\_\_, any \_\_\_\_\_ and are \_\_\_\_\_ conductors of electricity
    - tend to \_\_\_\_\_ valence electrons (form \_\_\_\_\_ charged ions called \_\_\_\_\_)
  - c) Metalloids
    - found \_\_\_\_\_ the “staircase” line
    - have \_\_\_, \_\_\_ or \_\_\_ valence electrons
    - have properties of both \_\_\_\_\_ and \_\_\_\_\_
    - can either \_\_\_\_\_ or \_\_\_\_\_ valence electrons
    - \_\_\_\_\_ is an example

## The Periodic Table

The Periodic Table of the Elements was originally developed, in the form that we are familiar with, by a Russian chemist named Dmitri Mendeleev. His table was based on observations of the chemical and physical properties of the elements known at the time. Mendeleev noticed that these properties repeated themselves over and over again when the elements were arranged in order of increasing atomic numbers. It was this repetition that led to the choice of the name “periodic”.

For our purposes, the table organizes the elements in three main ways:

### Metals and Non-Metals

Elements that tend to lose electrons and become positively charged ions are found on the left side of the periodic table. These elements are the **metals** and have the characteristic properties of metals: they are shiny, solid at room temperature, malleable, good conductors of heat and electricity, and have high melting points.

Elements that tend to gain electrons and become negatively charged ions are found on the right side of the periodic table. These elements are **non-metals** and have the characteristic properties of non-metals: they are dull (not shiny), liquid or gas at room temperature, brittle as solids, poor conductors of heat and electricity, and have low melting points.

There is no clear-cut division between the two types of elements but the “staircase” line, toward the right hand side of the table, separates the metallic elements from the non-metallic elements.

Elements near to this line may have properties of both types of elements, and are called **metalloids**.

### Families or Groups

The vertical columns in the periodic table organize the elements into groups or families based on the number of electrons in the outer (valence) shell. Each group is identified by a Roman Numeral (and may, or may not, use a letter of the alphabet as well).

Groups of elements have similar chemical and physical properties due to their similar electron arrangements. In groups of metals, the most reactive element is at the bottom of the family. In groups of non-metals, the most reactive element is at the top of the family.

The elements of one family, group VIII (also known as the INERT GASES or NOBLE GASES), are almost completely non-reactive because they have the stable octet electron arrangement (all of their electron shells are “full”).

### Periods

These are the horizontal rows across the table. In a period there is a gradual change from metals to non-metals as the atomic number increases and as the number of electrons in the valence shell increases. A period always starts with an element having one electron in the valence shell and ends with 8 electrons in this outer shell. (Period I is the only exception to this as the valence shell is the first shell which is capable of holding only 2 electrons).

Homework: Answer the following questions in **full sentences** in your **notebook**.

- What are **metals** and what type of ion do they form?
  - What are **non-metals** and what type of ion do they form?
  - Prepare a chart comparing the properties of metals and non-metals.
  - What are **metalloids** and where are they located on the Periodic Table?
- What are **Groups** or **Families** of elements?
  - Why are the elements in a Group so similar in their properties?
  - Where in the column would you find the **most** reactive: 1) metal    2) non-metal
- What is special about the Group VIII elements and why is this?
- What are **Periods** in the Periodic Table and what occurs as you move across a Period?

**Workplace Hazardous Materials Information System (WHMIS)** symbols were developed to standardize the labeling of dangerous materials used in all workplaces, including schools.

|  |  |  |  |
|--|--|--|--|
|   |  |   |  |
|   |  |   |  |
|   |  |   |  |
|   |  |   |  |
|  |  |  |  |

### Identify the Safety Hazards

|   |     |

| 7 | 15  |
| 8 | 16  |

## OUTLINE FOR LAB REPORTS

1. Each lab report is to be started on a new piece of paper.
2. Record data neatly in PEN, on the observation chart. Do NOT rely on others to make observations and notes for you. Keep your own records as you perform the work.
3. Lab marks will be given, in part, for neatness, completeness and accuracy of results. Another part of the mark will be for "participation".
4. Do not use personal pronouns in a lab report.
5. The format of the lab reports should be as follows:

**TITLE:** The title must be at the top of your lab report, and should fully describe the experiment that is being performed.

**PURPOSE:** The purpose must be written out in full and state the reason for doing the lab. This is usually found in the lab instructions.

**METHOD:** This section is a description of how the lab was performed. Explain the procedures as if you were instructing another person how to do the lab.

If the method is given to you in detail in your lab handout, you do not need to write it out again. Under the "Method" subheading, simply write: "Refer to lab handout".

**OBSERVATIONS:** This is the most important part of a lab report.

- Present your findings in an appropriate form. Numerical data, for example, is most often presented in a chart or table. All numerical data must include units.
- If you are recording your observations in a data table or chart, under the "Observation" subheading, write "Refer to Observation Table".
- Observation tables or charts must have a detailed title.
- It is good practice to describe the physical properties of the reactants before a reaction and then describe the products after the reaction. Include **AT LEAST** the state, colour and clarity of the reactants and products.
- DO NOT include calculations, interpretations or conclusions in this section.

**QUESTIONS:** Answer the questions that accompany the experiment in **full sentence format**.

**CALCULATIONS:** When calculations are necessary, you must show all of your work and include units.

**CONCLUSIONS:** This is a brief summary of the results of the experiment that relates back to the purpose of the experiment. Are the results reasonable considering the possible sources of error? Very often the answers to the questions and the answers to the calculations following the experiment will lead you to the conclusions for the lab.

**ERRORS:** Basically, an error statement is an explanation of why your results may be different from someone else who is doing the same experiment.

- Unless you are told otherwise, discuss three (or more) sources of **unavoidable** error in the experiment. All equipment, for example, has a certain, built-in error depending on its "quality".
- Pay attention when you are doing the experiment to observations that are difficult to measure or interpret; these are common sources of error.
- A statement of error should include both the **cause** of the error and what the **effect** of that error was on the lab results. For example, "When timing the runners, each person would start their stopwatch at a slightly different time, so there would be slight errors in the reported times."
- "Did the math wrong on my calculator." or "The glassware was not clean." are not acceptable sources of error. These are both **bad technique** and within your control.

At the end of a lab, you will be notified of when the lab report is due. Please hand in labs on time!!

**Labs will no longer be accepted for marking after the marked labs have been returned to the class.**

## Groups on the Periodic Table

**Group VIII:** \_\_\_\_\_ ( \_\_\_\_\_ )

- ◆ have a \_\_\_\_\_ outer electron shell, which is known as a \_\_\_\_\_
- ◆ these elements tend not to \_\_\_\_\_ or \_\_\_\_\_ electrons
- ◆ they are \_\_\_\_\_ or \_\_\_\_\_ and \_\_\_\_\_ with other elements

All atoms will \_\_\_\_\_, \_\_\_\_\_ or \_\_\_\_\_ valence electrons to achieve a \_\_\_\_\_ electron arrangement like the Noble Gases.

**Group I:** \_\_\_\_\_ ( \_\_\_\_\_ )

- ◆ elements in Group I have \_\_\_\_\_
- ◆ to achieve a stable octet arrangement, Group I elements tend to \_\_\_\_\_

The sodium atom loses one electron so it has \_\_\_\_\_. It still has \_\_\_\_\_ (the number of protons \_\_\_\_\_). It is now a “\_\_\_\_\_” or “\_\_\_\_\_”. The ion is written: \_\_\_\_\_

**Group II Elements:** \_\_\_\_\_ ( \_\_\_\_\_ )

- ◆ elements in Group II have \_\_\_\_\_
- ◆ to achieve a stable octet arrangement, Group II elements tend to \_\_\_\_\_

The beryllium atom loses two electrons so it has \_\_\_\_\_. It still has \_\_\_\_\_ (the number of protons \_\_\_\_\_). It is now a “\_\_\_\_\_” or “\_\_\_\_\_”. The ion is written: \_\_\_\_\_

## Group VI Elements ( )

- ◆ elements in Group VI have \_\_\_\_\_
- ◆ to achieve a stable octet arrangement, Group VI elements tend to \_\_\_\_\_

The sulfur atom gains two electrons so it has \_\_\_\_\_. It still has \_\_\_\_\_ (the number of protons \_\_\_\_\_). It is now a “\_\_\_\_\_” or “\_\_\_\_\_”. The ion is written: \_\_\_\_\_

## Group VII Elements: \_\_\_\_\_ ( )

- ◆ elements in Group VII have \_\_\_\_\_
- ◆ to achieve a stable octet arrangement, Group VII elements tend to \_\_\_\_\_

The chlorine atom gains one electron so it has \_\_\_\_\_. It still has \_\_\_\_\_ (the number of protons \_\_\_\_\_). It is now a “\_\_\_\_\_” or “\_\_\_\_\_”. The ion is written: \_\_\_\_\_

Other examples:

$^{13}\text{Al}$   
(Group III)

## Worksheet: The Periodic Table and the Formation of Ions

- Complete the following definitions and statements:
  - A horizontal row on the Periodic Table is called a \_\_\_\_\_.
  - A vertical column on the Periodic Table is called a \_\_\_\_\_ or \_\_\_\_\_.
  - All elements in the same period have the same number of \_\_\_\_\_.
  - All elements in the same group have the same number of \_\_\_\_\_.
  - A full outer electron shell (often with eight electrons) is called a \_\_\_\_\_.
  - A charged atom is called a(n) \_\_\_\_\_.
  - Metals are found on the (left/right) \_\_\_\_\_ side of the staircase line on the Periodic Table.
  - Non-metals tend to (gain/lose) \_\_\_\_\_ electrons to complete a stable octet electron arrangement.
  - Metals tend to form (positive/negative) \_\_\_\_\_ ions called \_\_\_\_\_.
  - Non-metals are found on the (left/right) \_\_\_\_\_ side of the staircase line on the Periodic Table.
  - In a neutral atom, the number of electrons is \_\_\_\_\_ to the number of protons in the nucleus.
  - Sulfur has \_\_\_\_\_ valence electrons, it is in Group \_\_\_\_\_ and is a (metal/non-metal) \_\_\_\_\_.

- Draw Rutherford-Bohr diagrams to show the formation of ions for:

a) Mg            b) S            c) Ca            d) N            e) K            f) Sc

- Refer to the periodic table to answer the following:

- An uncharged magnesium atom has \_\_\_\_\_ electron(s) in its outer shell.
  - ◆ It will tend to (gain/lose) \_\_\_\_\_ electrons to obtain a stable octet arrangement.
  - ◆ The resulting ion will have \_\_\_\_\_ protons, \_\_\_\_\_ electrons and an overall charge of \_\_\_\_\_.
- An uncharged chlorine atom has \_\_\_\_\_ electron(s) in its outer shell.
  - ◆ It will tend to (gain/lose) \_\_\_\_\_ electrons to obtain a stable octet arrangement.
  - ◆ The resulting ion will have \_\_\_\_\_ protons, \_\_\_\_\_ electrons and an overall charge of \_\_\_\_\_.
- An uncharged potassium atom has \_\_\_\_\_ electron(s) in its outer shell.
  - ◆ It will tend to (gain/lose) \_\_\_\_\_ electrons to obtain a stable octet arrangement.
  - ◆ The resulting ion will have \_\_\_\_\_ protons, \_\_\_\_\_ electrons and an overall charge of \_\_\_\_\_.
- An uncharged oxygen atom has \_\_\_\_\_ electron(s) in its outer shell.
  - ◆ It will tend to (gain/lose) \_\_\_\_\_ electrons to obtain a stable octet arrangement.
  - ◆ The resulting ion will have \_\_\_\_\_ protons, \_\_\_\_\_ electrons and an overall charge of \_\_\_\_\_.

- Complete the following chart:

| Element | Chemical Symbol | Atomic Number | # of Protons | # of Electrons | Total Charge | # of Neutrons | Mass Number |
|---------|-----------------|---------------|--------------|----------------|--------------|---------------|-------------|
| Carbon  |                 |               |              | 6              |              | 6             |             |
|         |                 | 33            |              |                | 3 -          |               | 74          |
|         | Mn              |               |              | 23             |              | 31            |             |
|         |                 |               | 15           | 18             |              |               | 30          |
|         |                 |               |              | 18             | 1 -          | 20            |             |
| Gold    |                 |               |              | 79             |              |               | 197         |
|         |                 | 29            |              |                | 1 +          |               | 63          |
|         | Ag              |               |              | 46             |              | 60            |             |
|         |                 |               |              | 22             | 2+           |               | 51          |
|         |                 |               | 36           |                | 0            | 48            |             |
|         | Cu              |               |              | 27             |              | 36            |             |

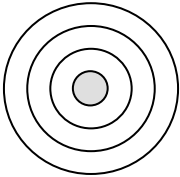

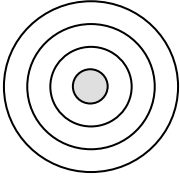

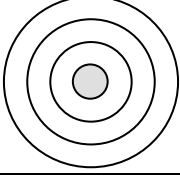

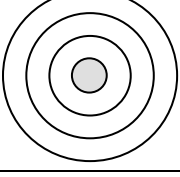

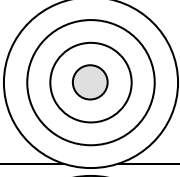

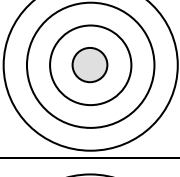

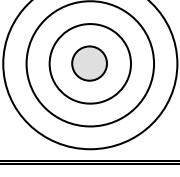

- From the chart in question 4: identify two isotopes of the same element.

## DRAWING ELECTRON DOT DIAGRAMS

Complete the following table, as shown in the examples:

| Element                           | Group # | # of Valence Electrons | Electron Dot Diagram of Neutral Atom | Electron Dot Diagram of Ion this atom forms. (Include its charge) |
|-----------------------------------|---------|------------------------|--------------------------------------|---|
| Mg                                | 2       | 2                      | Mg                                   | Mg <sup>2+</sup> (or Mg <sup>+2</sup> )                           |
| F                                 | 7       | 7                      | F                                    | F (or F <sup>-</sup> )  |
| B                                 |         |                        |                                      |   |
| O                                 |         |                        |                                      |   |
| Cl                                |         |                        |                                      |   |
| P                                 |         |                        |                                      |   |
| Al                                |         |                        |                                      |   |
| Be                                |         |                        |                                      |   |
| H                                 |         |                        |                                      |   |
| a Group 3 element with symbol "X" |         |                        |                                      |   |
| C                                 |         |                        |                                      |   |

**Review for Quiz #1: Atomic Structure (How it all Fits Together)**

| Element   | Atomic Number | # of Electrons in a Neutral Atom | Rutherford-Bohr Diagram   | # of Valence Electrons | Group # on Periodic Table | Electron Dot Diagram of Neutral Atom | Metal or Non-Metal? | Tends to Gain or Lose Electrons? | Charge on the Ion |
|-----------|---------------|----------------------------------|---|------------------------|---------------------------|--------------------------------------|---------------------|----------------------------------|-------------------|
| <b>Na</b> |               |                                  |    |                        |                           |                                      |                     |                                  |                   |
| <b>F</b>  |               |                                  |    |                        |                           |                                      |                     |                                  |                   |
| <b>Mg</b> |               |                                  |    |                        |                           |                                      |                     |                                  |                   |
| <b>O</b>  |               |                                  |    |                        |                           |                                      |                     |                                  |                   |
| <b>Al</b> |               |                                  |   |                        |                           |                                      |                     |                                  |                   |
| <b>Be</b> |               |                                  |  |                        |                           |                                      |                     |                                  |                   |
| <b>S</b>  |               |                                  |  |                        |                           |                                      |                     |                                  |                   |

## The Formation of Ionic Compounds

- atoms will \_\_\_\_\_ or \_\_\_\_\_ electrons to achieve a \_\_\_\_\_ electron arrangement
- when metal atoms \_\_\_\_\_ electrons, the electrons must be \_\_\_\_\_ to \_\_\_\_\_ atoms
- the number of electrons lost by the \_\_\_\_\_ atoms \_\_\_\_\_ the number of electrons gained by the \_\_\_\_\_ atoms
- when metal atoms \_\_\_\_\_ electrons, they form \_\_\_\_\_ charged ions called \_\_\_\_\_
- when non-metal atoms \_\_\_\_\_ electrons, they form \_\_\_\_\_ charged ions called \_\_\_\_\_
- the positive and negative ions are \_\_\_\_\_ to each other by \_\_\_\_\_ attraction ( attracts )
- together, the positive and negative ions form an \_\_\_\_\_
- the attraction between positive and negative ions is an \_\_\_\_\_

An **ionic compound** is a substance that forms when \_\_\_\_\_ and \_\_\_\_\_ ions are held together by \_\_\_\_\_ attraction (an \_\_\_\_\_).

### Showing the formation of ionic compounds using electron dot diagrams (EDDs):

**Step 1:** Draw EDDs for the elements as \_\_\_\_\_ atoms. Draw arrows to show how the \_\_\_\_\_ will move.

**Step 2:** Draw EDDs for the \_\_\_\_\_ that form. Include the \_\_\_\_\_ on the ions. Be sure that the number of positive charges \_\_\_\_\_ the number of negative charges.

**Step 3:** Write the \_\_\_\_\_ for the ionic compound. Always write the \_\_\_\_\_ first!!! If there is more than one of either of the ions, write a \_\_\_\_\_ after that element to indicate the number of each ion.

eg. show the formation of the ionic compound between calcium and fluorine:

**Step 1**

**Step 2**

**Step 3**

eg. show the formation of the ionic compound between sulfur and lithium:

**Step 1**

**Step 2**

**Step 3**

eg. aluminum and phosphorus:

**Step 1**

**Step 2**

**Step 3**

### **Naming Ionic Compounds:**

1. Name the \_\_\_\_\_ first. Use its regular name.
2. Name the \_\_\_\_\_ second. Change the ending of the non-metal to “\_\_\_\_\_”. Only non-metals get the “ide” name!

**Homework:** Follow the steps above to show the formation of the ionic compounds between the following elements. Name each compound:

1. K and O
2. Mg and I
3. Sc and N
4. Na and Cl
5. Sr and P
6. Al and S

### Investigation – The Properties of Ionic Compounds – Formula Determination

Complete this chart to show the formation of each ionic compound being investigated. Name each compound. (An example has been done for you). Write both the **name** and the **chemical formula** of the compound from the “Step 3” column in your Observation chart.

| Ionic Compound | Elements involved     | Step 1 | Step 2 | Step 3 |
|----------------|-----------------------|--------|--------|--------|
| Example        | sodium<br>phosphorus  |        |        |        |
| A              | lithium<br>sulfur     |        |        |        |
| B              | sodium<br>chloride    |        |        |        |
| C              | calcium<br>phosphorus |        |        |        |
| D              | aluminum<br>bromine   |        |        |        |
| E              | magnesium<br>nitrogen |        |        |        |
| F              | potassium<br>oxygen   |        |        |        |

## NAMES AND FORMULAS OF IONIC COMPOUNDS

Compounds containing \_\_\_\_\_ are called \_\_\_\_\_.

Scientists have agreed on a **universal** way to name these compounds.

### Some Rules we need to know:

1. The **metal** ion ***always*** appears \_\_\_\_\_ in the name or the formula of the compound.

2. The name of a **cation** (metal ion) is \_\_\_\_\_ the name of the **neutral atom**.

(eg: sodium → \_\_\_\_\_)

The name of an **anion** (non-metal ion) takes the name of the **neutral atom** and \_\_\_\_\_

\_\_\_\_\_ (eg: chlorine → \_\_\_\_\_)

3. When a formula for a compound contains a number in the \_\_\_\_\_ (\_\_\_\_\_)

position, this number tells us \_\_\_\_\_ ions of that type are in the compound.

(The **absence** of a number means there is just \_\_\_\_\_ ion of that type).

eg: Na<sub>2</sub>O

eg: CaCl<sub>2</sub>

4. The overall charge on the compound is \_\_\_\_\_, since the charge on the individual ions \_\_\_\_\_.

see "Ion Chart"

### Naming Ionic Compounds:

Examples: NaCl → \_\_\_\_\_

CaO → \_\_\_\_\_

BeF<sub>2</sub> → \_\_\_\_\_

K<sub>2</sub>S → \_\_\_\_\_

### Writing Formulas for Ionic Compounds:

The "Criss-cross" method:

-write the ions side by side (include the **value** and **type** of charge):

-“criss cross” the **value** of the charges (= subscripts):

(-leave out the signs since the charges balance out)

## NAMING AND WRITING FORMULAS OF IONIC COMPOUNDS # 1

1. Name each of the following compounds:

2. Write the formula for each of the following compounds:

a) beryllium fluoride

e) lithium oxide

b) sodium nitride

f) magnesium nitride

c) calcium sulfide

g) barium sulfide

d) aluminum chloride

h) potassium phosphide

## NAMING AND WRITING FORMULAS OF IONIC COMPOUNDS #2

1. Name each of the following compounds:

2. Write the formula for each of the following compounds:

a) potassium oxide

e) magnesium sulfide

b) aluminum sulfide

f) calcium phosphide

c) beryllium chloride

g) sodium sulfide

d) strontium bromide

h) cesium nitride

## Naming with Roman Numerals

Some metals can form ions with more than one charge:

- nickel can be \_\_\_\_\_ or \_\_\_\_\_
- copper can be \_\_\_\_\_ or \_\_\_\_\_
- gold can be \_\_\_\_\_ or \_\_\_\_\_
- lead can be \_\_\_\_\_ or \_\_\_\_\_

How do you know which ion you have? The charge of the metal ion is written in Roman Numerals after the name of the metal.

ex.  $\text{Fe}_2\text{O}_3$

ex.  $\text{CuS}$

eg. Write the chemical formulas for the following ionic compounds:

- nickel (III) sulfide: \_\_\_\_\_
- copper (II) oxide: \_\_\_\_\_
- lead (IV) carbide: \_\_\_\_\_
- gold (I) nitride: \_\_\_\_\_
- mercury (II) phosphide: \_\_\_\_\_
- chromium (II) fluoride: \_\_\_\_\_

eg. Write the name for the following ionic compounds. If a metal has more than one possible charge, indicate the charge using Roman Numerals:

a)  $\text{HgO}$

d)  $\text{Ni}_2\text{S}_3$

b)  $\text{PbI}_2$

e)  $\text{Na}_3\text{N}$

c)  $\text{FeP}$

f)  $\text{SnO}_2$

### Homework:

- Handout: Naming Compounds using Roman Numerals

### NAMING AND WRITING FORMULAS OF IONIC COMPOUNDS #3

1. Name each of the following compounds:

2. Write the formula for each of the following compounds:

a) chromium (II) oxide

e) iron (III) fluoride

b) lead (IV) sulfide

f) tin (IV) carbide

c) sodium bromide

g) silver oxide

d) cobalt (II) chloride

h) nickel (II) iodide

## NAMING AND WRITING FORMULAS OF IONIC COMPOUNDS #4

1. Name each of the following compounds:

2. Write the formula for each of the following compounds:

a) nickel (III) bromide

e) potassium chloride

b) aluminum oxide

f) iron (III) phosphide

c) manganese (IV) sulfide

g) arsenic (V) oxide

d) chromium (II) sulfide

h) antimony (III) fluoride

## NAMING IONIC COMPOUNDS

1. Write the formula for the following binary compounds:

|                     |                    |
|---------------------|--------------------|
| sodium fluoride     | zinc nitride       |
| silver nitride      | strontium oxide    |
| aluminum chloride   | aluminum carbide   |
| barium oxide        | lithium sulfide    |
| magnesium bromide   | beryllium iodide   |
| calcium sulfide     | hydrogen bromide   |
| lithium oxide       | potassium chloride |
| barium sulfide      | silver sulfide     |
| potassium phosphide | zinc carbide       |
| magnesium carbide   | boron nitride      |

2. Name the following binary compounds:

|                       |                         |
|-----------------------|-------------------------|
| $\text{Na}_2\text{O}$ | $\text{Zn}_3\text{P}_2$ |
| $\text{Li}_4\text{C}$ | $\text{Ba}_3\text{N}_2$ |
| $\text{MgBr}_2$       | $\text{MgO}$            |
| $\text{CsI}$          | $\text{CaS}$            |
| $\text{Ag}_3\text{N}$ | $\text{BeO}$            |
| $\text{Sr}_2\text{C}$ | $\text{ZnBr}_2$         |
| $\text{CaCl}_2$       | $\text{NaF}$            |
| $\text{BaO}$          | $\text{Sr}_3\text{P}_2$ |
| $\text{AlBr}_3$       | $\text{AgI}$            |
| $\text{H}_2\text{S}$  | $\text{AlN}$            |

## NAMING COMPOUNDS USING ROMAN NUMERALS

1. Write the formula for the following binary compounds:

|                        |                         |
|------------------------|-------------------------|
| copper (I) chloride    | tin (IV) oxide          |
| iron (II) nitride      | copper (II) fluoride    |
| lead (II) oxide        | chromium (II) phosphide |
| mercury (II) fluoride  | mercury (I) carbide     |
| magnesium bromide      | gold (III) chloride     |
| manganese (IV) sulfide | cobalt (II) bromide     |
| manganese (II) carbide | phosphorus (V) nitride  |
| gold (I) iodide        | nickel (III) phosphide  |
| iron (II) bromide      | copper (II) sulfide     |
| aluminum sulfide       | zinc iodide             |

2. Name the following binary compounds:

|                         |                         |
|-------------------------|-------------------------|
| $\text{Cu}_2\text{O}$   | $\text{P}_2\text{O}_5$  |
| $\text{Hg}_4\text{C}$   | $\text{Sn}_3\text{N}_2$ |
| $\text{AuBr}_3$         | $\text{CoO}$            |
| $\text{Mn}_3\text{N}_4$ | $\text{MnS}_2$          |
| $\text{Ag}_3\text{N}$   | $\text{Pb}_2\text{C}$   |
| $\text{FeF}_2$          | $\text{Sr}_3\text{P}_2$ |
| $\text{NiCl}_2$         | $\text{CuF}$            |
| $\text{HgO}$            | $\text{NiBr}_3$         |
| $\text{CoBr}_3$         | $\text{AgI}$            |
| $\text{CrS}$            | $\text{FeN}$            |

# WRITING FORMULAS FOR POLYATOMIC COMPOUNDS

---

Polyatomic compound: a type of ionic compound that...

- consists of more than two different elements
- the first half of the compound is a metal
- the second half of the compound is a “polyatomic ion”, made up of non-metals, but with one overall charge

1. The **metal** ion is always positive, and is written **first**.
2. The “**combo**”/**polyatomic** ion is usually negative, and is written **second**. (You will find these on your periodic table/ion chart.)

**\*\* The easiest way to make the formula of the compound is to use the *CROSSOVER RULE*.**

## Sample Question:

“Give the formula for the compound formed between sodium and phosphate.” (The ate ending should tell you that this is a polyatomic ion! Look at your ion chart!)

### Step 1:

· write the symbols for each of the substances in the compound, spaced apart, with the metal on the left and the non-metal combo on the right.

### Step 2:

· write the ionic charge of each of the substances on the TOP OF IT!! (from the P.T., count how many steps to perfection to get this number). This is just your working step.

### Step 3:

· cross the numbers over to the bottom of the opposite one. Drop the brackets ONLY if there is a number “1” outside of the polyatomic ion.

**\*\*\*\* Now, squish them together!\*\*\*\***

The final formula for the polyatomic compound of Na and PO<sub>4</sub> will be:

Try these ones:

- Calcium nitrate
- Aluminum carbonate
- Ammonium sulfide
- Chromium (III) hydrogen carbonate
- Scandium phosphate
- Lead (IV) sulfate
- Ammonium hydroxide

## NAMING POLYATOMIC COMPOUNDS

1. Name the following compounds (remember to use Roman Numerals, where necessary):

|                              |                              |
|------------------------------|------------------------------|
| $\text{Na}_2\text{SO}_4$     | $\text{Ni}(\text{OH})_3$     |
| $\text{Al}_2(\text{CO}_3)_3$ | $\text{Pb}(\text{NO}_3)_2$   |
| $\text{KNO}_3$               | $\text{HgHCO}_3$             |
| $\text{Li}_3\text{PO}_4$     | $\text{Cu}_2\text{SO}_4$     |
| $\text{Ag}_2\text{HPO}_4$    | $\text{NiSO}_4$              |
| $(\text{NH}_4)_4\text{C}$    | $\text{CoPO}_4$              |
| $\text{BaSO}_4$              | $\text{AuNO}_3$              |
| $\text{Zn}_3(\text{PO}_4)_2$ | $\text{Pb}(\text{HCO}_3)_4$  |
| $\text{Be}(\text{OH})_2$     | $\text{Fe}_2(\text{CO}_3)_3$ |
| $\text{Mg}(\text{NO}_3)_2$   | $\text{Mn}(\text{SO}_4)_2$   |
| $\text{Si}(\text{NO}_3)_4$   | $\text{NiPO}_4$              |
| $\text{ZnCO}_3$              | $\text{NH}_4\text{OH}$       |
| $(\text{NH}_4)_2\text{SO}_4$ | $\text{Sn}(\text{HPO}_4)_2$  |

2. Write the chemical formulas for the following ionic compounds:

|                                |                                |
|--------------------------------|--------------------------------|
| zinc hydrogen carbonate        | aluminum hydroxide             |
| calcium phosphate              | beryllium hydrogen phosphate   |
| iron (III) sulfate             | mercury (II) carbonate         |
| sodium hydrogen phosphate      | magnesium hydroxide            |
| iron (II) nitrate              | cobalt (II) carbonate          |
| tin (IV) nitrate               | sodium nitrate                 |
| lead (IV) hydroxide            | silver sulfate                 |
| ammonium sulfate               | manganese (IV) phosphate       |
| nickel (III) carbonate         | nickel (II) hydrogen phosphate |
| lead (II) phosphate            | ammonium carbonate             |
| mercury (I) hydrogen phosphate | gold (III) hydroxide           |

## FINAL REVIEW: CHEMICAL NAMES AND FORMULAS

1. Name these compounds:

|   |   |
|---|---|
| LiCl  | K <sub>2</sub> S                                |
| AlI <sub>3</sub>                                | ZnS   |
| BaF <sub>2</sub>                                | Mg <sub>3</sub> N <sub>2</sub>                  |
| MgO   | Na <sub>2</sub> O                               |
| H <sub>3</sub> P                                | Au <sub>3</sub> P                               |
| NH <sub>4</sub> F                               | K <sub>3</sub> PO <sub>4</sub>                  |
| FeSO <sub>4</sub>                               | Cu(OH) <sub>2</sub>                             |
| Al <sub>2</sub> (SO <sub>4</sub> ) <sub>3</sub> | Ca(NO <sub>3</sub> ) <sub>2</sub>               |
| Pb(OH) <sub>2</sub>                             | Sr <sub>3</sub> (PO <sub>4</sub> ) <sub>2</sub> |
| Fe(NO <sub>3</sub> ) <sub>3</sub>               | (NH <sub>4</sub> ) <sub>2</sub> SO <sub>4</sub> |
| Pb(HCO <sub>3</sub> ) <sub>2</sub>              | BaCO <sub>3</sub>                               |
| CuSO <sub>4</sub>                               | NiHPO <sub>4</sub>                              |

2. Write the chemical formula for:

|                             |                      |
|-----------------------------|----------------------|
| sodium fluoride             | calcium iodide       |
| lithium oxide               | rubidium bromide     |
| potassium bromide           | barium iodide        |
| aluminum chloride           | hydrogen phosphide   |
| iron(II) nitride            | silver sulfide       |
| iron(III) sulfide           | zinc chloride        |
| silver chloride             | barium sulfate       |
| potassium carbonate         | iron (III) sulfide   |
| iron(II) iodide             | calcium carbonate    |
| magnesium phosphate         | copper (II) bromide  |
| sodium hydrogen carbonate   | silver nitrate       |
| nickel(II) nitrate          | copper(II) sulfate   |
| tin(IV) hydroxide           | ammonium chloride    |
| chromium(III) oxide         | cobalt(III) chloride |
| iron(III) sulfate           | mercury(II) iodide   |
| nickel(II) hydroxide        | zinc sulfate         |
| ammonium hydrogen phosphate | sodium nitride       |
| aluminum fluoride           | ammonium nitrate     |
| barium phosphate            | gold(III) sulfate    |

## Explaining the Properties of Ionic Compounds

Ionic compounds are made of positive metal ions and negative non-metal ions which are attracted to one another by their charges.

Because all of the positive ions are attracted to all of the negative ions, ionic compounds form a huge network called a “crystal lattice”.

The positive and negative ions are locked together so tightly in the crystal lattice, ionic compounds have the following properties:

- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_
- \_\_\_\_\_

## Introduction to Covalent Bonding

All atoms are most stable when they have a \_\_\_\_\_ (a \_\_\_\_\_ electron arrangement).

Metals obtain a stable octet arrangement by \_\_\_\_\_ electrons.

Non-metals obtain a stable octet arrangement by \_\_\_\_\_ electrons. They can gain electrons in two ways:

1. Non-metals can \_\_\_\_\_ electrons from a \_\_\_\_\_ and form an \_\_\_\_\_ compound
2. Non-metals can \_\_\_\_\_ electrons with other \_\_\_\_\_ and form a \_\_\_\_\_ compound

When two or more non-metals are held together because they are \_\_\_\_\_ electrons, the bond is called a \_\_\_\_\_ bond, and the compound that forms is called a \_\_\_\_\_ compound.

Covalent compounds are also called \_\_\_\_\_. Technically, ionic compounds do not form \_\_\_\_\_.

You can tell if a compound is ionic or covalent from its chemical formula:

- Ionic compounds have a \_\_\_\_\_ as their first element
- Covalent compounds contain \_\_\_\_\_

You can also tell if a compound is ionic or covalent from its \_\_\_\_\_ or \_\_\_\_\_, as you will see in Lab #2.

**Drawing covalent compounds:**

1. Read the chemical formula to find how many of each type of atom must be bonded together. eg. NH<sub>3</sub> contains: \_\_\_\_\_
2. Draw the electron dot diagrams for all of the atoms. Usually, the first element will go in the centre of the molecule.
3. Draw lines to “pair up” the single electrons. Draw the lines in such a way that all of the single electrons get “paired up”.
4. Draw the molecule using “ ” to represent the shared electrons.
5. Draw in all of the electron pairs that did not participate in bonding.

eg. NH<sub>3</sub>

Draw: HCl    H<sub>2</sub>S    OF<sub>2</sub>    CF<sub>2</sub>Cl<sub>2</sub>    O<sub>2</sub>    N<sub>2</sub>  
          NOCl<sub>3</sub>    CH<sub>2</sub>O    C<sub>2</sub>H<sub>4</sub>    H<sub>2</sub>O<sub>2</sub>    CO<sub>2</sub>H<sub>2</sub>

## Grade 10 Science Covalent Bonding

**Elements** are pure substances that contain only one type of atom.

**Compounds** are pure substances that contain two or more types of atoms, chemically combined in definite proportions.

There are two types of compounds:

**1. Ionic compounds:** these compounds form between the **ions** of metals and non-metals, based on electrostatic attraction between oppositely charged ions; for example:  $\text{MgCl}_2$ ,  $\text{NaF}$ ,  $\text{CaO}$ ,  $\text{Na}_2\text{S}$

**2. Covalent compounds:** these compounds are formed between two or more non-metal atoms, and are based on the non-metal atoms “sharing” electrons between them; for example,  $\text{H}_2\text{O}$ ,  $\text{CO}_2$ ,  $\text{FCl}$ ,  $\text{NO}_2$ .

### Example of Covalent Bonding, $\text{H}_2\text{O}$ :

A neutral oxygen atom has 8 electrons, 2 in the first shell and 6 in its outer shell.

A neutral hydrogen atom has 1 electron in its outer shell (hydrogen behaves as both a metal and a non-metal, it will often bond covalently with other non-metals).

The outer electrons arrange themselves so that they are positioned in between the atoms, completing the outer orbits of both atoms at the same time. The sharing of the electrons holds the atoms together and is called a **covalent bond**. There are no electrical charges involved in covalent bonding.

Covalent compounds are uncharged and contain only non-metal atoms. Like ionic compounds, the atoms always combine in definite proportions, and the proportion depends on the number of electrons in the outer shell of the non-metal atoms. Covalent compounds are also called **molecules**.

For both ionic and covalent compounds, the ratio of elements in the compound can be written in a short form called a **chemical formula**. The chemical formula indicates two pieces of information:

- the type of elements which are combined to make up the compound
- the number of each element present in the compound. The number written as a subscript after an element tells us the number of atoms of that element in the compound.

Your knowledge of metals and non-metals will tell you if the compound is an ionic compound or a molecule (covalent compound).

eg. **NaCl**: a metal plus a non-metal, so it is an ionic compound made of one sodium ion combined with one chloride ion

eg. **MgBr<sub>2</sub>**: a metal plus a non-metal, so it is an ionic compound made of one magnesium ion combined with two bromine ions

eg. **SO<sub>2</sub>**: two non-metal atoms, so it is a molecule (covalent compound) made of one sulfur atom with two oxygen atoms

## Covalent Compounds

1. Complete the chart “Classification of Matter”, including the three types of elements and the two types of compounds.

2. Define compound, ionic compound, covalent compound, molecule and electrolyte.
3. Complete the following chart, assuming that hydrogen is a non-metal. Use the chemical formula to find the number of atoms or ions of each element that are present in each compound.

| Chemical Formula | Ionic or Covalent Compound | Number Of Each Type Of Atom Or Ion Present |
|------------------|----------------------------|--|
| $K_2S$           |                            |  |
| $C_2H_2F_4$      |                            |  |
| $Na_2O$          |                            |  |
| $NO_2$           |                            |  |
| $Li_3N$          |                            |  |
| $Ba(NO_3)_2$     |                            |  |
| $C_6H_{12}O_6$   |                            |  |
| $CO_2$           |                            |  |
| $PbSO_4$         |                            |  |
| $C_2H_6O$        |                            |  |
| $Ca(HCO_3)_2$    |                            |  |
| $PBr_3$          |                            |  |
| $Sn_3(PO_4)_4$   |                            |  |
| $CCl_4$          |                            |  |

4. Would two metal atoms ever bond with each other? Why or why not?
5. Draw electron dot diagrams to show the electron arrangements in the following **molecules**:
- a)  $ClF$       b)  $H_2S$       c)  $CH_4$       d)  $H_2O$       e)  $PCl_3$       f)  $C_2H_4Cl_2$       g)  $CF_2Br_2$
6. Summarize the properties of ionic and covalent compounds (from lab #1) including the presence of an odour, melting point, do they dissolve in water and do they conduct electricity in solution.

## Naming Binary Covalent Compounds

- Ionic compounds form when \_\_\_\_\_ atoms bond with \_\_\_\_\_ atoms. They are named using the rules for naming ionic compounds that we have been learning up until now.
- Covalent (molecular) compounds form when two or more \_\_\_\_\_ atoms are bonded together. **Binary** covalent compounds have a different naming system, the \_\_\_\_\_ system.
- Remember, binary compounds (ionic or covalent) contain \_\_\_\_\_.

### The Rules for the Prefix System:

1. Name the first element with its normal name. Indicate the number of atoms of the first element with a prefix. If there is only one atom of the first element, then a prefix is not used for that element:  
CO<sub>2</sub> is \_\_\_\_\_  
N<sub>2</sub>H<sub>4</sub> is \_\_\_\_\_
2. Write the name of the second element, changing the end of its name to \_\_\_\_\_. Indicate the number of atoms of the second element with a prefix.
3. If the second element is oxygen and the prefix ends in an “o” or “a”, then the “o” or “a” from the prefix is left off.

eg. CO is \_\_\_\_\_  
P<sub>2</sub>O<sub>5</sub> is \_\_\_\_\_  
N<sub>2</sub>O<sub>4</sub> is \_\_\_\_\_  
Cl<sub>2</sub>O<sub>7</sub> is \_\_\_\_\_

| Prefix |
|--------|
| 1 is   |
| 2 is   |
| 3 is   |
| 4 is   |
| 5 is   |
| 6 is   |
| 7 is   |
| 8 is   |
| 9 is   |
| 10 is  |

### Examples:

|   |                            |
|---|----------------------------|
| SeO <sub>3</sub> is _____               | carbon tetrachloride _____ |
| S <sub>2</sub> Cl <sub>2</sub> is _____ | diboron triphosphide _____ |
| BH <sub>3</sub> is _____                | sulfur hexafluoride _____  |
| P <sub>4</sub> O <sub>10</sub> is _____ | dinitrogen pentoxide _____ |

**Practice:** Name the following binary covalent compounds using the prefix system:

|                               |                                |
|-------------------------------|--------------------------------|
| SO <sub>2</sub>               | NF <sub>3</sub>                |
| CCl <sub>4</sub>              | N <sub>2</sub> H <sub>2</sub>  |
| SO <sub>3</sub>               | P <sub>2</sub> H <sub>4</sub>  |
| ClF <sub>3</sub>              | BI <sub>3</sub>                |
| PF <sub>5</sub>               | SiBr <sub>4</sub>              |
| SCl <sub>6</sub>              | NCl <sub>3</sub>               |
| N <sub>2</sub> S <sub>2</sub> | P <sub>4</sub> S <sub>10</sub> |
| PBr <sub>3</sub>              | SeF <sub>4</sub>               |
| C <sub>3</sub> H <sub>8</sub> | SiO <sub>2</sub>               |
| P <sub>4</sub> S <sub>3</sub> | N <sub>2</sub> O               |
| NO <sub>2</sub>               | CS <sub>2</sub>                |
| OF <sub>2</sub>               | PBr <sub>5</sub>               |

## Introduction to Chemical Reactions

Chemical reactions occur when the atoms in the \_\_\_\_\_ are rearranged to form new substances, called \_\_\_\_\_. The products have new \_\_\_\_\_.

A chemical reaction has occurred if:

1. there is a \_\_\_\_\_
2. a \_\_\_\_\_ is produced (\_\_\_\_\_ or \_\_\_\_\_). It may have an \_\_\_\_\_
3. energy is released or absorbed in the form of \_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_, or \_\_\_\_\_
4. a \_\_\_\_\_ is formed (a solid that forms when two solutions are mixed).  
You know a \_\_\_\_\_ has formed if the mixture goes \_\_\_\_\_.

**Note:** changes of state (\_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_ or \_\_\_\_\_) are NOT chemical changes!

Chemical reactions can be written two ways:

- 1) as \_\_\_\_\_ using the names of the substances involved

(“→” means \_\_\_\_\_)

- 2) as \_\_\_\_\_ using the chemical formulas of the substances involved

We can write \_\_\_\_\_ equations and \_\_\_\_\_ equations from descriptions of chemical reactions.

eg. calcium chloride is broken down to produce chlorine gas ( $\text{Cl}_2$ ) and calcium metal

**Step 1:** write the word equation

**Step 2:** use the criss-cross rule to convert the names of the substances into their chemical formulas

You need to memorize the following chemical formulas:

- oxygen gas is \_\_\_\_\_ (when things burn in air, they are really reacting with \_\_\_\_\_ )
- nitrogen gas is \_\_\_\_\_
- hydrogen gas is \_\_\_\_\_
- pure metals are written as just their chemical symbols, with \_\_\_\_\_  
and \_\_\_\_\_

eg. sodium metal is \_\_\_\_\_                      lead metal is \_\_\_\_\_  
copper metal is \_\_\_\_\_                      iron metal is \_\_\_\_\_  
mercury metal is \_\_\_\_\_                      tin metal is \_\_\_\_\_

When writing chemical equations, always follow these steps:

Step 1: write the word equation

Step 2: use the criss-cross rule to change the chemical names into chemical formulas

eg. when zinc metal reacts with hydrochloric acid (HCl), it produces hydrogen gas and zinc chloride

eg. when methane ( $\text{CH}_4$ ) burns in air, it produces carbon dioxide and water vapour

eg. when silver nitrate is mixed with sodium chloride, silver chloride and sodium nitrate are formed

eg. when lead metal is placed in copper (II) nitrate, it forms copper metal and lead (II) nitrate

**Homework:** complete question sheet on chemical reactions

## Balancing Chemical Equations

Chemical reactions occur when the atoms in the \_\_\_\_\_ are \_\_\_\_\_ to form new substances, called \_\_\_\_\_.

The \_\_\_\_\_ tells us that the \_\_\_\_\_ of the \_\_\_\_\_ of a chemical reaction is \_\_\_\_\_ to the \_\_\_\_\_ of the \_\_\_\_\_ before the chemical reaction.

That is, during a chemical reaction, the atoms are \_\_\_\_\_ to form new substances but the \_\_\_\_\_ and type of \_\_\_\_\_ that you have after a chemical reaction must be \_\_\_\_\_ what you started with. Atoms can not be \_\_\_\_\_ nor \_\_\_\_\_ during a chemical reaction.

For this reason, chemical reactions must be written in their \_\_\_\_\_ form.

### Hints for Balancing:

1. Start with the element (atom) that has the \_\_\_\_\_ subscript.
2. If an atom has “\_\_\_\_\_ or \_\_\_\_\_” for a subscript, it may help to put a coefficient of \_\_\_\_\_ in front of that substance.
3. Balance the number of atoms of an element, using \_\_\_\_\_ in front of the substances. Do **NOT** change the \_\_\_\_\_ of the compounds.
4. Generally, balance elements that are by themselves last ( $\text{H}_2$ ,  $\text{O}_2$ , Fe etc.)
5. “Ping-pong” back and forth between the reactants and products until all of the atoms are balanced.
6. Double check your work.

## BALANCING EQUATIONS #1

1.  $\text{Al} + \text{S} \rightarrow \text{Al}_2\text{S}_3$
2.  $\text{Sn} + \text{Cl}_2 \rightarrow \text{SnCl}_4$
3.  $\text{ZnO} \rightarrow \text{Zn} + \text{O}_2$
4.  $\text{H}_2 + \text{O}_2 \rightarrow \text{H}_2\text{O}$
5.  $\text{Cu}_2\text{O} \rightarrow \text{Cu} + \text{O}_2$
6.  $\text{Cu} + \text{S}_8 \rightarrow \text{Cu}_2\text{S}$
7.  $\text{P}_4 + \text{O}_2 \rightarrow \text{P}_4\text{O}_{10}$
8.  $\text{NO}_2 \rightarrow \text{N}_2 + \text{O}_2$
9.  $\text{H}_2 + \text{I}_2 \rightarrow \text{HI}$
10.  $\text{HgO} \rightarrow \text{Hg} + \text{O}_2$
11.  $\text{H}_2 + \text{N}_2 \rightarrow \text{NH}_3$
12.  $\text{NaCl} + \text{Br}_2 \rightarrow \text{NaBr} + \text{Cl}_2$
13.  $\text{SiO}_2 + \text{HF} \rightarrow \text{SiF}_4 + \text{H}_2\text{O}$
14.  $\text{Fe}_2\text{O}_3 \rightarrow \text{Fe} + \text{O}_2$
15.  $\text{K} + \text{Br}_2 \rightarrow \text{KBr}$
16.  $\text{Ca} + \text{HI} \rightarrow \text{CaI}_2 + \text{H}_2$
17.  $\text{Na} + \text{O}_2 \rightarrow \text{Na}_2\text{O}$
18.  $\text{BiCl}_3 \rightarrow \text{Bi} + \text{Cl}_2$
19.  $\text{CO} + \text{O}_2 \rightarrow \text{CO}_2$
20.  $\text{Mg} + \text{HCl} \rightarrow \text{H}_2 + \text{MgCl}_2$
21.  $\text{H}_2\text{O}_2 \rightarrow \text{H}_2\text{O} + \text{O}_2$
22.  $\text{Al}_2\text{O}_3 \rightarrow \text{Al} + \text{O}_2$
23.  $\text{P}_5 + \text{H}_2 \rightarrow \text{PH}_3$

## BALANCING EQUATIONS #2

1.  $\text{CaS} + \text{KCl} \rightarrow \text{CaCl}_2 + \text{K}_2\text{S}$
2.  $\text{Na} + \text{Cl}_2 \rightarrow \text{NaCl}$
3.  $\text{Al} + \text{O}_2 \rightarrow \text{Al}_2\text{O}_3$
4.  $\text{AlN} + \text{CaO} \rightarrow \text{Al}_2\text{O}_3 + \text{Ca}_3\text{N}_2$
5.  $\text{AlCl}_3 \rightarrow \text{Al} + \text{Cl}_2$
6.  $\text{N}_2 + \text{NH}_4\text{Cl} \rightarrow (\text{NH}_4)_3\text{N} + \text{Cl}_2$
7.  $\text{Na}_2\text{CO}_3 + \text{Ca} \rightarrow \text{CaCO}_3 + \text{Na}$
8.  $\text{Al}(\text{NO}_3)_3 + \text{Na}_2\text{CO}_3 \rightarrow \text{NaNO}_3 + \text{Al}_2(\text{CO}_3)_3$
9.  $(\text{NH}_4)_2\text{O} + \text{Ca}(\text{NO}_3)_2 \rightarrow \text{NH}_4\text{NO}_3 + \text{CaO}$
10.  $\text{AgNO}_3 + \text{K}_2\text{S} \rightarrow \text{KNO}_3 + \text{Ag}_2\text{S}$
11.  $\text{BaCl}_2 + \text{Na}_2\text{CO}_3 \rightarrow \text{BaCO}_3 + \text{NaCl}$
12.  $\text{Ca}(\text{NO}_3)_2 + \text{Li}_3\text{PO}_4 \rightarrow \text{Ca}_3(\text{PO}_4)_2 + \text{LiNO}_3$
13.  $\text{Mg} + \text{CuSO}_4 \rightarrow \text{MgSO}_4 + \text{Cu}$
14.  $\text{NH}_4\text{Br} + \text{Cl}_2 \rightarrow \text{NH}_4\text{Cl} + \text{Br}_2$
15.  $\text{Zn} + \text{HCl} \rightarrow \text{ZnCl}_2 + \text{H}_2$
16.  $\text{I}_2 + \text{KF} \rightarrow \text{KI} + \text{F}_2$
17.  $\text{Li}_2\text{O} + \text{SO}_2 \rightarrow \text{Li}_2\text{SO}_3$
18.  $\text{FeS} + \text{HCl} \rightarrow \text{FeCl}_2 + \text{H}_2\text{S}$
19.  $\text{NH}_4\text{Cl} + \text{NaOH} \rightarrow \text{NH}_4\text{OH} + \text{NaCl}$
20.  $\text{Na}_2\text{SO}_3 + \text{HNO}_3 \rightarrow \text{NaNO}_3 + \text{H}_2\text{SO}_3$
21.  $\text{Fe}_2(\text{SO}_4)_3 + \text{NaOH} \rightarrow \text{Na}_2\text{SO}_4 + \text{Fe}(\text{OH})_3$
22.  $\text{Fe}_2\text{O}_3 + \text{C} \rightarrow \text{Fe} + \text{CO}_2$
23.  $\text{NH}_4\text{Cl} + \text{Na}_3\text{PO}_4 \rightarrow (\text{NH}_4)_3\text{PO}_4 + \text{NaCl}$

## Writing and Balancing Chemical Equations

For the following chemical reactions:

Step 1. Write the word equation.

Step 2. Write the chemical equation (use the criss-cross rule to find the formulas of ionic compounds).

Step 3. Balance the chemical equation.

1. Silver metal reacts with hydrogen sulfide ( $\text{H}_2\text{S}$ ) to form silver sulfide and hydrogen gas.
2. When pentane ( $\text{C}_5\text{H}_{12}$ ) burns in air, it produces carbon dioxide and water vapour.
3. When ammonia ( $\text{NH}_3$ ) reacts with water it produces ammonium hydroxide.
4. When gold metal is placed in nitric acid ( $\text{HNO}_3$ ) it produces gold (I) nitrate and hydrogen gas.
5. When lead metal is added to nickel (II) sulfate, it produces nickel metal and lead (II) sulfate.
6. When nonane ( $\text{C}_9\text{H}_{20}$ ) burns in air, it produces carbon dioxide and water vapour.
7. When sodium azide ( $\text{NaN}_3$ ) reacts, it produces nitrogen gas and sodium metal.

## Types of Chemical Reactions

Chemical reactions can be classified into types. Four common types of reactions are:

1. **Synthesis Reactions**: two or more reactants combine to form \_\_\_\_\_  
\_\_\_\_\_. (synthesis means \_\_\_\_\_)

In general:

Examples:

2. **Decomposition Reactions**: \_\_\_\_\_ breaks down to form two  
or more products.

In general:

Examples:

3. **Single Displacement Reactions**: the atoms from \_\_\_\_\_ reactants are  
\_\_\_\_\_ to form \_\_\_\_\_ different products. A single element replaces a  
similar element in a compound.

In general:

Examples:

4. **Double Displacement Reactions:** \_\_\_\_\_ reactants are rearranged to form \_\_\_\_\_ new products. The atoms in the reactants \_\_\_\_\_.

In general:

Examples:

**Classify the following unbalanced reactions as synthesis (synth), decomposition (decomp), single displacement (SD) or double displacement (DD):**

## Types of Chemical Reactions

Read pages 190 to 191 and 194 to 195 in your textbook. Answer the following questions.

1. Which type of chemical reaction has only one reactant? \_\_\_\_\_
2. Which type of chemical reaction has only one product? \_\_\_\_\_
3. Clearly distinguish between a single displacement and a double displacement reaction. How can you recognize each type?
4. Balance each of the following reactions and classify them as single or double displacement reactions:

5. Balance each of the following equations and classify the reactions as synthesis, decomposition, single or double displacement reactions:

## Acids, Bases and Neutral Substances

All compounds can be classified as either \_\_\_\_\_, \_\_\_\_\_ or \_\_\_\_\_ substances. Each has specific \_\_\_\_\_ (characteristics) and \_\_\_\_\_.

**Acids** are compounds that dissolve in \_\_\_\_\_ to produce \_\_\_\_\_ ions. All acids have \_\_\_\_\_ as their first element.

Four common acids are:

1. **Hydrochloric acid** ( \_\_\_\_\_ )

- a \_\_\_\_\_ acid
- also known as “ \_\_\_\_\_ ”, which is used as a \_\_\_\_\_ and to treat the water in \_\_\_\_\_
- found in our \_\_\_\_\_, where it \_\_\_\_\_ and \_\_\_\_\_ in food

2. **Sulfuric acid** ( \_\_\_\_\_ )

- a \_\_\_\_\_ acid
- also known as “ \_\_\_\_\_ ” because it is used in \_\_\_\_\_
- found in \_\_\_\_\_ and is produced when \_\_\_\_\_ from \_\_\_\_\_ ( \_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_ ) is burned

3. **Acetic acid** ( \_\_\_\_\_ )

- a \_\_\_\_\_ acid
- it is \_\_\_\_\_ (in \_\_\_\_\_ concentrations)
- \_\_\_\_\_ is a \_\_\_\_\_ solution of acetic acid

4. **Carbonic acid** ( $H_2CO_3$ )

- a \_\_\_\_\_ acid
- forms when \_\_\_\_\_ ( \_\_\_\_\_ ) is dissolved in water
- used to “ \_\_\_\_\_ ” \_\_\_\_\_ and make it “ \_\_\_\_\_ ”

Other acids include:

**Bases** are compounds that dissolve in \_\_\_\_\_ to produce \_\_\_\_\_ ( \_\_\_\_\_ ) ions. Bases are also called “ \_\_\_\_\_ ” substances.

Four common bases are:

1. **Sodium hydroxide** ( \_\_\_\_\_ )
  - a \_\_\_\_\_ base
  - used in \_\_\_\_\_ and \_\_\_\_\_ ( \_\_\_\_\_ )
2. **Potassium hydroxide** ( \_\_\_\_\_ )
  - a \_\_\_\_\_ base
  - also known as “ \_\_\_\_\_ ” which can be made from the \_\_\_\_\_
  - used to make \_\_\_\_\_ ( \_\_\_\_\_ ) and as a \_\_\_\_\_
3. **Ammonium hydroxide** ( \_\_\_\_\_ )
  - a \_\_\_\_\_ base
  - used in many \_\_\_\_\_ such as “ \_\_\_\_\_ ” and \_\_\_\_\_ cleaners
4. **Sodium bicarbonate** ( \_\_\_\_\_, \_\_\_\_\_ )
  - a \_\_\_\_\_ base
  - also known as \_\_\_\_\_, which is used as a “ \_\_\_\_\_ ” for baking to make \_\_\_\_\_ and \_\_\_\_\_ rise

**Neutral substances** are substances that contain either:

- a) \_\_\_\_\_ of \_\_\_\_\_ and \_\_\_\_\_ ( \_\_\_\_\_ ) ions  
eg. \_\_\_\_\_
- b) neither \_\_\_\_\_ nor \_\_\_\_\_ ions  
eg. \_\_\_\_\_, \_\_\_\_\_

Neutral substances are a \_\_\_\_\_ group of compounds that have \_\_\_\_\_ of the \_\_\_\_\_ of acids and bases.

## Reactions of Acids and Bases

Acids and bases behave in predictable ways in many chemical reactions. For example:

1. When an acid reacts with a \_\_\_\_\_, the products of the reaction are always \_\_\_\_\_ ( ) and a \_\_\_\_\_.

A **salt** is an \_\_\_\_\_ compound that does not contain the \_\_\_\_\_ ( ) ion.

2. When an acid reacts with a \_\_\_\_\_ ( ), the products of the reaction are always \_\_\_\_\_ gas ( ), \_\_\_\_\_ and a \_\_\_\_\_.

Many antacids contain carbonates. Tums contains \_\_\_\_\_ ( ). Other antacids contain \_\_\_\_\_ ( ).

3. When an acid and a \_\_\_\_\_ are mixed, a \_\_\_\_\_ reaction occurs. The products are always \_\_\_\_\_ and a \_\_\_\_\_. The reactions of acids and bases are also called \_\_\_\_\_ reactions because the products are \_\_\_\_\_ and no longer have the properties of \_\_\_\_\_ and \_\_\_\_\_.

The reactions of acids and bases have many common applications. For example, the venom of insects often contains an \_\_\_\_\_. When the insect stings you, they inject you with their venom and the acid causes \_\_\_\_\_ and \_\_\_\_\_. “\_\_\_\_\_” is a product that contains \_\_\_\_\_ (a weak \_\_\_\_\_). It neutralizes the acid and takes away the pain.

Homework: Complete the worksheet: Reactions of Acids and Bases

## Practice Writing Chemical Equations for Acids and Bases

Write word equations and balanced chemical equations for the following reactions:

1. Calcium metal reacts with nitric acid ( $\text{HNO}_3$ ).
2. Potassium carbonate reacts with hydrobromic acid ( $\text{HBr}$ ).
3. Hydrofluoric acid ( $\text{HF}$ ) reacts with potassium hydroxide.
4. Cadmium metal reacts with sulfuric acid.
5. Calcium hydroxide reacts with carbonic acid.
6. Ammonium chloride reacts with barium hydroxide to produce ammonia gas ( $\text{NH}_3$ ), water vapour and barium chloride.
7. Aluminum metal reacts with phosphoric acid ( $\text{H}_3\text{PO}_4$ ).
8. Magnesium carbonate reacts with hydroiodic acid ( $\text{HI}$ ).
